## 1. The function

1 / 1 point

$$\beta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 2 & -1 \\ -1 & 1 \end{bmatrix} \mathbf{y}$$

is

positive definite

 Correct

Yes, the matrix has only positive eigenvalues and  $\beta(\mathbf{x}, \mathbf{x}) > 0$  for all  $\mathbf{x} \neq \mathbf{0}$  and  
 $\beta(\mathbf{x}, \mathbf{x}) = 0 \iff \mathbf{x} = \mathbf{0}$

not positive definite

symmetric

 Correct

Yes:  $\beta(\mathbf{x}, \mathbf{y}) = \beta(\mathbf{y}, \mathbf{x})$

not symmetric

not an inner product

an inner product

 Correct

It's symmetric, bilinear and positive definite. Therefore, it is a valid inner product.

bilinear

 Correct

Yes:

- $\beta$  is symmetric. Therefore, we only need to show linearity in one argument.
- For any  $\lambda \in \mathbb{R}$  it holds that  $\beta(\mathbf{x} + \lambda\mathbf{z}, \mathbf{y}) = \beta(\mathbf{x}, \mathbf{y}) + \lambda\beta(\mathbf{z}, \mathbf{y})$ . This holds because of the rules for vector-matrix multiplication and addition.

not bilinear

$$\beta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix} \mathbf{y}$$

is

- positive definite
- an inner product
- bilinear

 **Correct**

Correct:

- $\beta$  is symmetric. Therefore, we only need to show linearity in one argument.
- $\beta(\mathbf{x} + \lambda\mathbf{z}, \mathbf{y}) = \beta(\mathbf{x}, \mathbf{y}) + \lambda\beta(\mathbf{z}, \mathbf{y})$ . This holds because of the rules for vector-matrix multiplication and addition.

- not an inner product

 **Correct**Correct: Since  $\beta$  is not positive definite, it cannot be an inner product.

- not bilinear
- symmetric

 **Correct**Correct:  $\beta(\mathbf{x}, \mathbf{y}) = \beta(\mathbf{y}, \mathbf{x})$ 

- not positive definite

 **Correct**With  $\mathbf{x} = [1, 1]^T$  we get  $\beta(\mathbf{x}, \mathbf{x}) = 0$ . Therefore  $\beta$  is not positive definite.

- not symmetric

## 3. The function

1 / 1 point

$$\beta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 2 & 1 \\ -1 & 1 \end{bmatrix} \mathbf{y}$$

is

- symmetric
- not symmetric

 **Correct**

Correct: If we take  $\mathbf{x} = [1, 1]^T$  and  $\mathbf{y} = [2, -1]^T$  then  $\beta(\mathbf{x}, \mathbf{y}) = 0$  but  $\beta(\mathbf{y}, \mathbf{x}) = 6$ .  
Therefore,  $\beta$  is not symmetric.

- bilinear

 **Correct**

Correct.

- not bilinear
- an inner product
- not an inner product

 **Correct**

Correct: Symmetry is violated.

## 4. The function

1 / 1 point

$$\beta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \mathbf{y}$$

is

 bilinear**Correct**

It is the dot product, which we know already. Therefore, it is positive bilinear.

 not bilinear not positive definite not an inner product symmetric**Correct**

It is the dot product, which we know already. Therefore, it is symmetric.

 not symmetric positive definite**Correct**

It is the dot product, which we know already. Therefore, it is positive definite.

 an inner product**Correct**

It is the dot product, which we know already. Therefore, it is also an inner product.

5. For any two vectors  $\mathbf{x}, \mathbf{y} \in \mathbb{R}^2$  write a short piece of code that defines a valid inner product.

1 / 1 point

```
1 import numpy as np
2
3 def dot(a, b):
4     """Compute dot product between a and b.
5     Args:
6         a, b: (2,) ndarray as R^2 vectors
7
8     Returns:
9         a number which is the dot product between a, b
10    """
11
12    dot_product = a @ b
13
14    return dot_product
15
16 # Test your code before you submit.
17 a = np.array([1,0])
18 b = np.array([0,1])
19 print(dot(a,b))
```

Run

Reset

Good job!
